1   ABSTRACT OF THE DISCLOSURE.

2

3   A financial data analysis system comprises a computer having a

4   communication means for obtaining data related to a security; means for storing

5   the data in memory; means for obtaining a second data point and means for

6   storing the second data point in memory; means for comparing the data from the

7   data points with data of an additional data point, which is randomly chosen from

8   between the data points; and a display means to display the compared data. The

9   system orders the randomly chosen data points prior to comparing data, then

10 displays it as, for example, a table, spreadsheet export file, or graph. The

11 compared data can be exported to a method of analyzing financial data. An

12 individual can track a securities portfolio, monitor performance and make

13 investment decisions based on performance. This invention may also analyze non-

14 financial data.
